TripleVOD Video on Demand

Create and Manage Your Media Content with HD VoD

With the advent of increased quality, high speed broadband networks, the desire for Video on Demand services in all areas of life has grown exponentially. The ability to access video content from any device at any time is something that has become requisite rather than optional for the majority of organisations. And so, with this change, controlling that content is now more important than ever.

TripleVOD from Tripleplay is an expandable, standards based, multi-purpose, Video on Demand solution, designed to give administrators an easy job and the end user an exceptional experience.
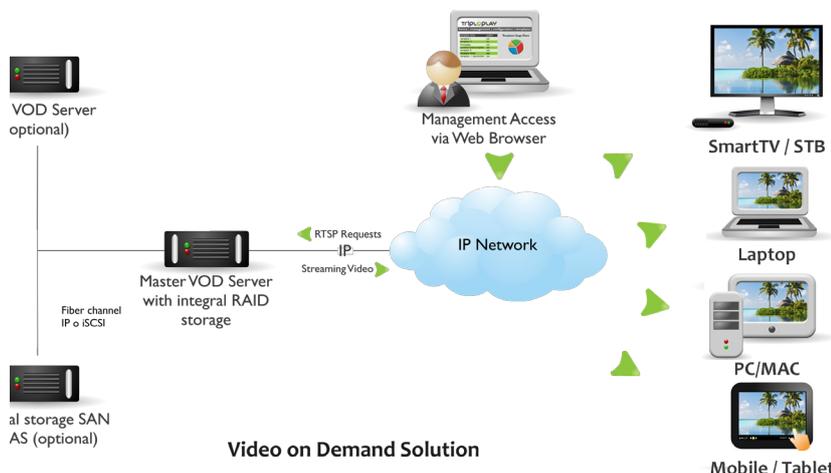

Customisable and innovative front end designs for your VoD service

A simple to use web based management system ensures administrators have a real time representation of the activities occurring on the platform. Through the use of Simple Network Management Protocol (SNMP), support alarms may be raised to ensure awareness of any potential issues with the platform before they occur. Options to track which videos are being viewed on the system and encrypted content are standard features of the TripleVOD product.

Streaming content "On demand" from a single platform provides great flexibility, allowing an administrator to initially manage a small number of users, but with the potential of scaling to several hundred, using the same infrastructure, giving added peace of mind that the solution is future proof. Tripleplay's TripleVOD offers this unique solution.

By implementing a standards based Real Time Streaming Protocol (RTSP), which manages end user video sessions and requests, you are ensured of the necessary quality of service levels and video streaming demands on the system.

"It's simple, intuitive and our guests get a wonderful experience every time."
Liz Uliana, Owner/Founder

TripleVOD HD Video on Demand

TripleVOD provides support for on demand streaming of MPEG-2 and MPEG-4 standard and high definition content. An integrated content management system simplifies the management of information associated within the video content.

Content in other file formats including WMA, AVI and Quicktime can also be accessed via the TripleVOD streaming solution, ensuring it will act as a central repository for all of your digital media.

In addition, Tripleplay's unique software architecture allows multiple services to operate on the same TripleVOD platform thereby turning the unit into an Application Server which can also support IP television and digital signage if required.

KEY FACTS

- Full platform extendability
- Intuitive and familiar user experience
- Simple configuration and maintenance through web interface
- Includes Hollywood studio approved content encryption option
- SNMP Management
- Compatible with all main IP Set Top Box manufacturers
- Supports Secure Media encryption
- Support for up to 200 concurrent video streams on a single VOD unit
- Standard and High Definition formats supported
- 500GB to 6TB single unit VoD head end units available
- Simple integration into Tripleplay's TripleSign and TripleTV solutions
